

Notes:

Indicates POWER Ground.

U5 - TL431 is marked CJ431 on PCB.

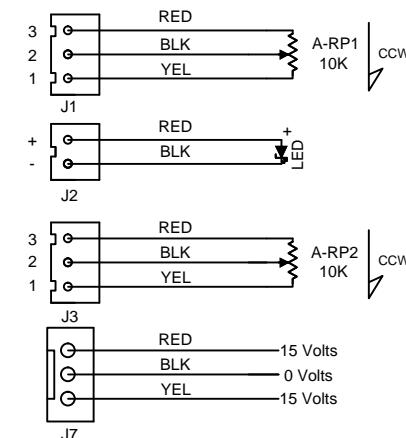

VR1 sets maximum Current Output.

VR2 sets maximum Voltage Limit.

$A_{pwr}$  Control presents the voltage drop across R24 & 25, averaged, to U1A, pin 2. U1A compares this voltage with the fraction of the Voltage Reference presented to pin 3. If pin 2 voltage exceeds pin 3, U1A pin 1 is pulled low lighting the LED and limiting the Output Voltage.

$V_{pwr}$  Control is developed by U1B. Voltage divider R9, R10 presents a stable fraction of Voltage Reference to pin 6 (Inverting Input) while pin 5 (Non-Inverting Input) receives a variable voltage via the movable tap of V-RP2. The amplifier output, pin 7, provides  $V_{pwr}$  Control.
